SUMMARY

Backend Engineer with 3 years of experience building scalable backend systems, REST APIs, and database-driven applications. Specialized in Go (Golang), with hands-on experience in API design, database optimization, unit testing, Swagger documentation, Docker-based development environments, and microservice architecture. Experienced in refactoring systems, improving API performance, and mentoring team members in Go development. Experienced in implementing database transactions and idempotent processing to maintain data consistency and prevent duplicate processing.

WORK EXPERIENCE

PT Nusapala Berkah Autonomous – Jakarta

Backend Developer

Jul 2025 – Present

- Design, develop, and maintain scalable backend systems using Go and multiple database technologies, including MySQL and PostgreSQL.
- Translate Functional Specification Documents (FSD) into backend implementation, including API design, service logic, database workflows, and integration requirements.
- Implement database transactions across multi-step business workflows to maintain data consistency and prevent partial updates.
- Implement unit tests, Swagger API documentation, and reusable backend patterns to improve code quality, maintainability, and API integration.
- Handle thousands of backend requests by optimizing API performance, database queries, and service reliability.
- Create and maintain reusable Go project templates with Docker and Docker Compose configurations to standardize project structure, configuration, middleware, routing, Swagger, and testing setup.
- Collaborate with Frontend Engineers, System Analysts, DevOps, and UI/UX Designers to deliver backend features aligned with requirements, API integration, deployment, and usability.
- Mentor team members in Go development through code reviews, technical guidance, and backend best practice sharing.
- Debug and resolve backend issues within services by analyzing logs, API behavior, and database queries.

PT Padjadjaran Teknologi Informasi (PLABS.ID) – Bandung

Software Engineer

Feb 2024 – May 2025

- Designed, developed, and maintained backend systems using multiple database technologies, including MySQL, PostgreSQL, Microsoft SQL Server, and Oracle.
- Integrated third-party services including Firebase Cloud Messaging (FCM) and Google Cloud Storage (GCS).
- Implemented cron jobs and goroutine-based concurrency in Go.
- Optimized database performance through schema design, query tuning, and implementing caching solutions with Redis.
- Collaborated with Project Managers (requirements), Frontend teams (API integration), DevOps (deployment pipelines), and UI/UX designers (system usability).
- Utilized Lark for daily task management and project tracking.

Junior Software Engineer

Sep 2023 – Feb 2024

- Developed backend systems using Go and PostgreSQL, including database design and REST API implementation.
- Managed development tasks and sprint deliverables using Jira in an Agile environment.
- Contributed to code reviews and maintained technical documentation.
- Mentored vocational high school interns in backend development from scratch using Go and PostgreSQL, guiding them to build functional CRUD APIs with JWT authentication within 3 months.
- Continuously improved backend systems through active learning of performance optimization techniques.

Software Engineer Intern

May 2023 – Sep 2023

- Delved deep into Go, learning its intricacies for backend development.
- Gained a strong foundation in database concepts and their application in backend systems.

- Strengthened backend development fundamentals through hands-on experience in API development, database design, debugging, and code optimization.

PROJECT EXPERIENCE

NATA HR

Backend Engineer for PT Nusapala Berkah Autonomous

- Engineered core backend services for a SaaS-based HRIS platform using Go, PostgreSQL, Redis, and microservice architecture.
- Built Master Service and Transaction Service modules supporting employee management, attendance, payroll, approval workflows, and mobile app operations.
- Developed payroll and attendance calculation workflows with transactional guarantees to prevent partial updates and maintain data consistency across multi-step business processes.
- Implemented idempotent processing patterns for retry-safe backend operations, reducing the risk of duplicate processing in payroll and attendance workflows.
- Optimized attendance and payroll processing by applying Redis caching and database denormalization to reduce repeated calls to Master Service and improve response time.
- Created a custom API Gateway in Go to manage routing, authentication middleware, request enrichment, correlation IDs, and inter-service communication.
- Implemented background workers and scheduled jobs for payroll, attendance, and operational processes, with structured logging for traceability and easier debugging.
- Implemented observability using Grafana, Loki, Alloy, and Prometheus, enabling centralized logs, metrics tracking, and faster issue investigation across backend services.
- Improved API reliability through database query optimization, transaction handling, Swagger documentation, and reusable backend patterns.

MyNusapala

Backend Engineer for PT Nusapala Berkah Autonomous

- Developed and optimized Go-based mobile APIs for a parking membership application, supporting membership packages, parking transactions, user profiles, and mobile app operations.
- Integrated Xendit and Midtrans payment services to support membership payments and GoPay account linking.
- Implemented bridge-based data synchronization to route requests by location ID to multiple Laravel APIs and sync parking location data into the local database.
- Refactored backend services from Laravel to Go, improving API performance, response time, and maintainability by restructuring API logic and database access.

NATA Asset

Backend Engineer for PT Nusapala Berkah Autonomous

- Built Go-based backend services for an Asset Management System using PostgreSQL, supporting asset tracking, inventory workflows, and reliable data management.

Jangum

Backend Engineer for PT Nusapala Berkah Autonomous

- Built backend APIs for the mobile application using Go and MySQL.
- Developed API endpoints to support general operational features and mobile integration.

Tawada Travel & Budget Control Apps – Indonesia

Backend Engineer for PLABS.ID

- Developed the backend for internal request and budget control application, designed to streamline processes for 1000+ employees in creating various submission requests.
- Implemented a budget control system with divisional approval workflows and integrated with Epicor for data synchronization.
- Managed scheduled tasks and background processes using cron jobs to ensure efficient operations.

Endermo Compro

Backend Engineer for PLABS.ID

- Developed a company profile website, including its Content Management System (CMS) and frontend interface, utilizing GORM for database interactions.

Conference Tool

Backend Engineer for PLABS.ID

- Built the backend for a Conference Management using Next.js (API routes), Drizzle ORM and Supertokens

Warehouse Management System

Backend Engineer for PLABS.ID

- Developed a Warehouse Management System to manage inbound and outbound goods shipments.
- Implemented stock opname using RFID technology.

Tawada Compro

Backend Engineer for PLABS.ID

- Developed a company profile website, including its Content Management System (CMS) and frontend interface.

SEZ Solution

Backend Engineer for PLABS.ID

- Developed a microservice-based application for managing company goods inflow and outflow, used by both internal teams and vendors.
- Contributed to the distributed architecture, gaining practical experience with Kafka for inter-service communication across its microservices for admin and client applications.

Ilya Tours

Backend Engineer for PLABS.ID

- Developed a Travel Operations Management System for international travel.
- Engineered comprehensive backend functionalities, including automated customer to room assignments and streamlined management of travel logistics.

Singgalang HS

Backend Engineer for PLABS.ID

- Maintained and supported an RFID Inventory Management app to manage the stock of a gold store.
- The backend primarily utilized Laravel, with Go implemented for specific modules to enhance performance.

EDUCATION

Assalaam Bandung Vocational High School

Jun 2020 – Jun 2023

Major: Software Engineering

Focused on Laravel-based web development and MySQL database systems. Supplemented my studies with basic Java programming and Flutter for mobile app prototyping.

SKILLS

Backend: Go (Golang), REST API, Microservices, API Gateway

Frameworks: Echo, Fiber, Gin, Laravel

Databases: PostgreSQL, MySQL, Microsoft SQL Server, Oracle, MongoDB, Redis

Tools: Git, GitHub, GitLab, Docker, Docker Compose, Postman, Swagger, Jira, Lark, CI/CD

Observability: Grafana, Loki, Alloy, Prometheus

Testing: Unit Testing

Languages: Indonesian (Native), English (Intermediate)
